Priya Anand

Principal Product Manager, API Platforms & Partner Integrations

priya.anand@example.com · (555) 020-1177 · Toronto, ON · US work-eligible (TN-1) · github.com/example/priyaanand · linkedin.com/in/example-priyaanand

KEY TECHNICAL IMPACT

- **API Modernization:** Retired a legacy API with 4,000 customers — 94% migrated, zero cutover incidents.
- **Partner Integrations:** Bank and vault-vendor integrations across three countries; 2,300 partners, 41B calls/month.
- **Strategy & ROI:** Authored the platform strategy; usage pricing defended to the CFO — metered revenue +34% year one.

PROFESSIONAL EXPERIENCE

Cassline (payments infrastructure) — Principal Product Manager, Developer Platform — Mar 2021 – Present

Toronto · remote-first team

- Own the public developer platform — REST APIs, SDKs, docs, pricing, partner tooling; partners grew from ~400 to 2,300.
- Rebuilt onboarding around an open sandbox and instant keys — median time to first API call fell from 9 days to 40 minutes.
- Retired legacy API v1 for 4,000 dependent customers — deprecation schedule, usage dashboards, a translation proxy, codemods, outreach run with sales — 94% migrated before the hard date with zero cutover incidents and <0.5% revenue lost.
- Reclaimed the 31% of platform engineering capacity that v1 parity work consumed; three features blocked on dual-surface support shipped within two quarters on the normal release train.
- Resolved the migration's hardest issue — the largest v1 holdout, a marketplace processor settling eight figures monthly — co-writing its migration plan and running a full month-end cycle in parallel on v2 before cutover; the account renewed.
- Shipped API v2 with scoped keys and an idempotency contract on every write endpoint; authored the dated-version policy — 18-month minimum support, Sunset headers — after migration-curve data overruled my 12-month proposal.
- Designed the usage-based pricing model — per-call bands, volume discounts, annual commitments with metered overage co-designed with finance — modeled on 12 months of call logs for ~600 partners; metered revenue +34% in year one.
- Owned a pricing-transition walk-back — extended a 60-day grandfathering window to 12 months after 18% of a 146-partner segment churned — and set the 90-day observation-window standard that now gates every pricing migration.
- Wrote the build-vs-buy decision record — buy the tokenization core, build the orchestration layer — saving an estimated 9–12 engineer-months in year one, and managed the vendor dependency through contractual roadmap escalations.
- Recruited and managed three PMs (two promoted) across five engineering teams in a remote-first org; the platform's written strategy is on version 4, argued with in the open by engineering, finance and sales.

Cartway (marketplace platform) — Senior Product Manager → Lead PM, Seller Payments — Sep 2017 – Feb 2021

Toronto → hybrid

- Owned seller payments end to end for 11,000 active sellers — payout timing, risk holds, the money experience; a payout-timing redesign cut "where is my money" support tickets 41%.
- Led the three-country payout expansion (Canada and UK launched), negotiating bank-partner SLAs, cutoffs and reconciliation formats, plus a degraded payout mode that carried two partner outages — sellers grew +62% and +48% in year one.
- Killed the Germany expansion at pilot when licensing timelines broke the unit economics; the one-page kill memo (~$650K year-one cost vs. 140 pilot sellers) became the org's template for later sunset decisions.
- Redesigned seller-tooling subscription pricing through a pre-registered A/B on 18,400 accounts — my own hypothesis lost; the winning structure lifted paid conversion from 3.1% to 4.6% and revenue per seller +9%.
- Promoted to Lead PM to hold the cross-team payments roadmap; replaced a weekly status meeting with a written decisions log.

Ferroline Systems (logistics software) — Backend Engineer, Integrations → Product Manager, Internal Tools — Jun 2012 – Aug 2017

Toronto · became the company's first PM for internal products in Jul 2015

- Built the shipment-exception platform from an evening Python/Postgres prototype to the company standard — 14 ops teams adopted it, per-exception handling time fell 31%, and the last Access database was retired.
- Started as an integrations engineer — carrier EDI, webhook fan-out, retry queues; wrote the API style guide that outlived me.

SKILLS

API & Platform: API product management · platform strategy · API versioning & deprecation programs · SDKs, docs & developer onboarding · REST & webhook design

Partners & Enterprise: partner & vendor integrations · SLA and reconciliation contracts · B2B & enterprise sales cycles · pricing & packaging · ROI and business-case modeling · multi-year roadmaps

Leadership: PM hiring & mentoring · vision-setting through written strategy · cross-functional alignment · remote-first global collaboration · 0→1 and scale

Technical: Python · SQL · distributed-systems fundamentals (idempotency, retries, delivery semantics)

EDUCATION

Braeburn School of Business — MBA, product strategy concentration (evening program) — 2013 – 2015

Halden University — BS, Computer Science — 2008 – 2012
